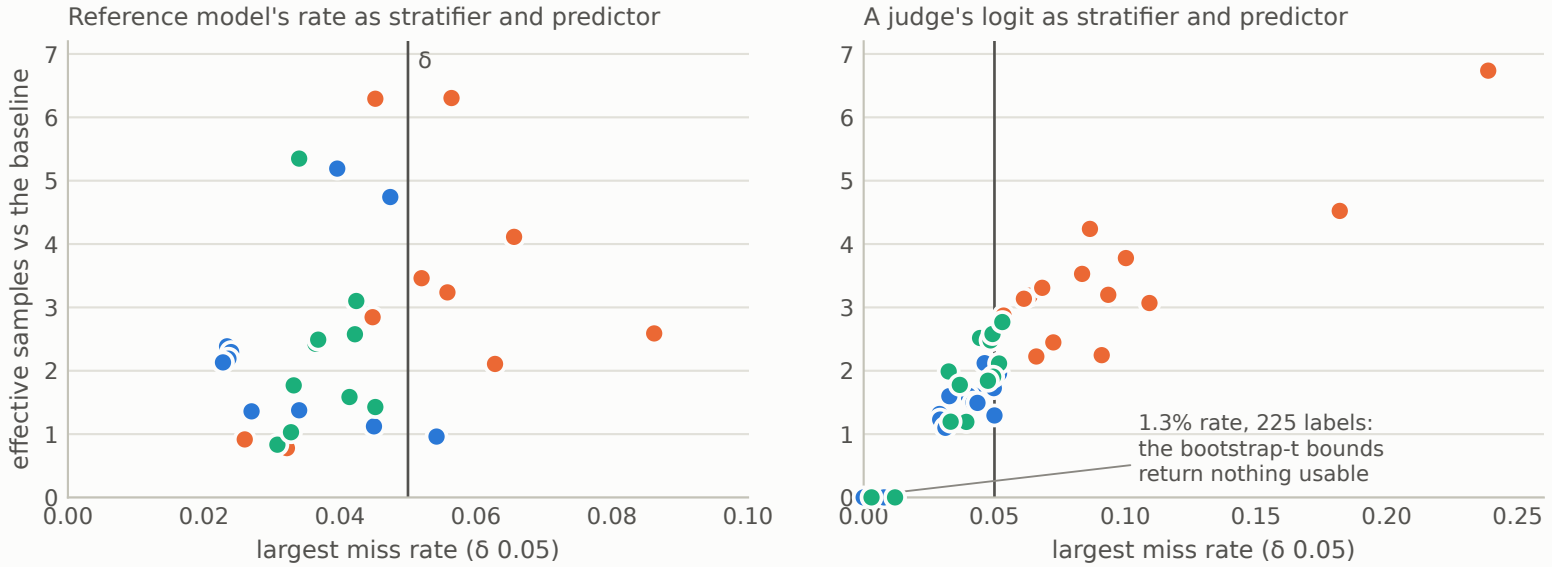
StratPPI's interval is shorter partly because it runs over its level; with a bootstrap-t limit its estimator is not over on these pools

Each dot is one cell (a label and a sample size). Right of the line the miss rate is above delta (within two standard errors it is unresolved). Baseline: a random split with a pooled Wilson bound (left), the labels alone (right).


- stratified Wilson-type bound b1w (left; section 8.1.5 recommends the Wald-t limit instead), PPI++ with a bootstrap-t limit (right)
- StratPPI as published, with its normal-quantile limit
- StratPPI's estimator with a bootstrap-t limit
